BEMS servicing does not have to halt during this period.

With our tailored remote servicing package (using on-site controls and sensors), we are able to conduct exercises to ensure your building is operating as expected. This also capitalises on any available savings during the COVID-19 outbreak.

This is done by:

- monitoring of setpoints, time zones and field sensors
- testing of controls where possible
- reviewing improvements which can be made to your system directly via the control strategy.

In addition to this, email notifications can then be set up to notify site of any M&E Failures.
